

hypotensive are separated from soybean paste made from beans, and bean sprouts contain asparagine which protects the liver from hangovers.

- However, bean curds are conventionally prepared using brine, and a new preparation method of bean curds has not been developed from the
- 5 conventional method. Brine is a by-product obtained when sea salt absorbs moisture in the air due to its deliquescence property to dissolve and wash away ingredients other than the salts, over a long period of time. Accordingly, brine comprises various dissolved ingredients which are contained in sea water, including cations such as magnesium that are known
- 10 to play an important role in making bean curds.

A deficiency in magnesium causes serious health problems since magnesium ions are physiologically important, but a high intake thereof can also cause physical problems. In addition, unpurified salts generate a bitter taste due to magnesium ions.

- 15 Accordingly, it can be predicted that the magnesium intake of Koreans exceeds a sufficient amount since bean curds made using brine are presently sold on the market, and unpurified salts are used in homes. Although the amount of magnesium intake from bean curds is not excessive because the amount of magnesium remaining in bean curds is not large,
- 20 since Koreans habitually use sauces including fermented soybeans, considering the amount of magnesium contained in sauces, they consume an excessive amount of magnesium and are consequently attacked by related diseases of adults.

ART 34 AMDT
PCT/KR00/01461

IPEA/KR 22.02.2002

In addition, the taste of bean curds can be good while they are hot, but it cannot be preserved for a long time even if stored cold.

Particularly, bean curds are difficult to preserve for even one day without refrigeration, and microorganisms can grow under conditions in which constituents other than protein contained in beans remain even in trace amounts. However, there is no remedy for these problems.

Bean curds containing lactic acid are presently sold on the market, and Korean Patent Application No. 98-1089 discloses a method for preparing bean curds by lactic acid fermentation. However, according to the method, lactic acid is fermented and aged in soybeans to prepare bean curds containing lactic acid, and the method has a disadvantage in that manufacturing costs are high because it uses expensive dairy products such as milk as well as beans, etc. as raw materials.

SUMMARY OF THE INVENTION

The present invention is made to solve these problems, and it is an object of the present invention to provide a method for preparing bean curds by using lactic acid bacteria culture, and to provide bean curds prepared according to the method. According to the method of the present invention, bean curds are prepared using lactic acid bacteria culture thereby eliminating factors hazardous to health, the lactic acid in lactic acid fermenting foods such as Kimchi is used thereby decreasing manufacturing costs, and the growth of Gram negative bacteria is inhibited due to lactic acid and lactic acid bacteria, thereby increasing storage properties and microbiological safety of

ART 34 AMDT
PCT/KR00/01461

IPEA/KR 22.02.2002

bean curds.

It is another object of the present invention to provide a method for preparing a beverage containing lactic acid using bean soup remaining after preparing bean curds according to the above method, and to provide a
5 beverage containing lactic acid prepared according to the method.

In order to achieve these objects, the present invention provides a method for preparing bean curds by adding lactic acid bacteria culture comprising the steps of:

- a) preparing lactic acid bacteria culture by fermenting i) salt, sugar,
10 water and ii) material which is one or more selected from a group consisting of vegetables, fruits, and a mixture thereof with lactic acid bacteria;
- b) preparing the bean soup by pulverizing the soaked soybeans in water, heating, and filtering; and
- 15 c) adding the lactic acid bacteria culture of step a) to the bean soup cooled at 40 °C.

In addition, the present invention provides bean curds prepared according to the method.

Specifically, the bean curds prepared according to the present
20 invention comprises living lactic acid bacteria that increases the preservation property of bean curds compared to conventional bean curds, and also increases probability that lactic acid reaches the intestine when the bean curds are digested to increase intestine-cleaning effects.

ART 34 AMDT
PCT/KR00/01461
IPEA/KR 22.02.2002

The lactic acid bacteria culture is preferably prepared by mixing one or more of vegetables, fruits and mushrooms at room temperature using purified water such as tapped water in a basic medium comprising 2.5% salts and 1 % sugar. Although the lactic acid bacteria can be prepared at room
5 temperature without sterilization, sterilizing and aseptic operation should be preceded with for commercial production.

Favorable lactic acid bacteria existing in Kimchi are found in the lactic acid bacteria culture prepared as the above.

Any vegetables including radishes, cabbages, etc. can be used as
10 the vegetables, and any fruit including pears, pineapples, etc. can be used as the fruits.

In addition, bean curd dregs which is solid components produced after filtering heated soybeans, can be added to one material or more selected from vegetables, fruits, and mushrooms. Specifically, the bean
15 curd dregs can be utilized as good nitrogen and carbon sources when culturing lactic acid bacteria, because they are pulverized beans and can be further decomposed using microorganism enzymes. The bean curd dregs can be a substitute for medium for culturing the lactic acid, it cuts down the production cost.

20 Lactic acid bacteria have a property of inhibiting the growths of disease-causing bacteria and harmful bacteria because of the lactic acid produced by lactic acid fermentation, and they are used as a medicine for intestinal disorders because they inhabit the intestine to prevent abnormal

fermentation of various bacteria. In addition, they are Gram positive and are common anaerobic or anaerobic bacteria, they have no motility, most are catalase negative, and they require various vitamins, amino acids, peptides, etc. for their growth. These lactic acid bacteria are largely classified into

5 lactic acid bacillus and lactic acid micrococcus.

The representative example of the lactic acid bacillus is lactic acid bacteria pertaining to the genus *Lactobacillus*, which are aerobic lactic acid bacteria existing in the intestine of all mammals and in other animals, and are used to treat autopoisoning of the intestine.

10 The lactic acid micrococcus is further classified into the genera *Streptococcus*, *Pediococcus* and *Leuconostoc*, the lactic acid bacteria pertaining to the genus *Pediococcus* is streptococcus, and *P. pentosaceus* is mainly found in Kimchi. In addition, lactic acid bacteria pertaining to the genus *Leuconostoc* are diplococcus and *L. mesenteroides* produce a lot of

15 gluten-like substance from sugar.

In the present invention, lactic acid bacteria pertaining to the genus *Leuconostoc* are preferably produced, because they are found in lactic acid fermenting foods such as Kimchi, they produce a similar amount of lactic acid as lactic acid bacteria pertaining to other genera and they are

20 inexpensive.

The degree of lactic acid production decreases to pH 5.0 or lower within 48 hours after fermentation in the case of natural fermentation, thereby inhibiting the growth of non-acid resistant bacteria. Lactic acid

ART 34 AMDT**PCT/KR00/01461**
IPEA/ER 22.02.2002

bacteria culture undergoing sufficient lactic acid production for 72 hours or more is preferably used. Other lactic acid bacteria can be used to prepare bean curd by controlling growth conditions when preparing lactic acid bacteria culture.

5 The preferable lactic acid bacteria culture is from Kimchi.

In addition, bean curd is conventionally prepared in hot conditions by boiling bean soup, while in the present invention, lactic acid bacteria culture is added to bean soup after the bean soup is cooled so that the bean curd contains living lactic acid bacteria. Thus, even when cooked at high
10 temperature, although lactic acid bacteria cannot survive, the effect of the lactic acid intake lasts and adult disease prevention and intestine cleaning effects are shown, and the bean curd preserving effect is still shown until that point.

The temperature to which to cool the bean soup is preferably 40 °C
15 or less.

Conventionally, in order to prepare bean curd, raw material soybeans are carefully selected and adulterants other than soybeans are removed. After selection, the soybeans are washed well and soaked in water to sufficiently absorb water. At this point, the weight of the soybeans
20 increases by approximately 2.2 to 2.3 times. The soybeans are pulverized while absorbing water, and the pulverized soybeans are heated to approximately 100 °C using sour milk neutralized with Ca(OH)_2 or silicon resin as a deformer. The heated pulverized soybeans are filtered to obtain

bean soup, and the bean soup is coagulated at 70 to 75 °C using brine or CaCl₂, etc., while stirring, to obtain bean curd. In the present invention, after coagulating the bean soup at 70 to 75 °C, the heated pulverized soybeans are cooled, and lactic acid bacteria culture is added to the cooled
5 soybeans without using brine or CaCl₂ to coagulate the bean soup, thereby preparing bean curd comprising lactic acid bacteria.

The present invention also provides a method for preparing a beverage containing lactic acid bacteria as the above by mixing bean soup remaining after preparing bean curd using the lactic acid bacteria culture with
10 syrup or fruit juice.

For example of the present invention, a beverage containing lactic acid bacteria as the above comprising the steps of:

- a) preparing lactic acid bacteria culture by fermenting i) salt, sugar, water and ii) material which is one or more selected from a
15 group consisting of vegetables, fruits, and a mixture thereof with lactic acid bacteria;
- b) preparing the bean soup by pulverizing the soaked soy bean in water, heating, and filtering;
- c) adding the lactic acid bacteria culture of step a) to the bean soup
20 cooled at 40 °C and
- d) mixing syrup or fruit juice with the bean soup remaining after preparing bean curds of step c).

The present invention also provides a lactic acid beverage.

The bean soup remaining after preparing bean curd contains various organic substances such as amino acids, vitamins, fiber, etc., inorganic salts and important lactic acid bacteria. Thus a healthy lactic acid beverage can be prepared by adding additives containing appropriate favors such as syrup
5 or fruit juice, etc. to the bean soup.

Accordingly, as shown in Fig. 1, lactic acid bean curd can be prepared by preparing bean soup using soybeans, cooling it at 40 °C and introducing lactic acid bacteria culture into the cooled bean soup, and it can also be prepared by preparing lactic acid bacteria culture using bean dregs
10 remaining after preparing bean soup and introducing the lactic acid bacteria culture into the cooled bean soup. Also, lactic acid beverage can be prepared by adding additives such as syrup and fruit juice to the bean dregs remaining after preparing bean curd.

In addition, the present invention can be prepared bean curd adding
15 the lactic acid bacteria culture, and prepared bean curd adding organic acid.

For example of the present invention, a bean curd as the above comprising the steps of:

- a) soaking soybeans in water;
- b) pulverizing the soaked soybeans of step a);
- 20 c) heating the pulverized soybeans of step b) using a deformer;
- d) filtering the heated pulverized soybeans of step c) to prepare bean soup; and
- e) cooling at 40 °C the bean soup of step d) and adding lactic acid

IPEA/IR 22.02.2002

thereto.

The organic acid is preferably lactic acid or acetic acid.

BRIEF DESCRIPTION OF THE DRAWINGS

Fig. 1 shows a process chart for preparing lactic acid bean curd and
5 a lactic acid beverage according to one embodiment of the present invention.

DETAILED DESCRIPTION AND THE PREFERRED EMBODIMENTS

The present invention will now be explained with reference to the following Examples. However, these are to illustrate the present invention and the present invention is not limited to them.

10 Examples 1 – 7

50 g of cabbage, 60 g of garlic, 100 g of pear, 40 g of unripe hot peppers, 65 g of pineapple, 10 g of potatoes and 75 g of radish were weighed and introduced into each 360 mL bottles. A mixture of salts and sugar was prepared by mixing 100 g of salts, 40 g of sugar, and water such
15 that the mixture reached 4 L. 330, 337, 301, 347, 337, 290 and 284 mL of the mixture were respectively introduced into each bottle, and the bottles were left to stand at room temperature for 3 days.

The pH of the lactic acid bacteria culture prepared according to the Examples 1 – 7 was 3.5.

20 Comparative Example 1

The solution was prepared by mixing salts, sugar and water. The pH of the solution was 6.0.

Examples 8 – 14

ART 34 AMDT**PCT/KR00/01461****IPEA/ER 22. 02. 2002**

Bean curds for Examples 8 to 14 were prepared by adding 3 mL of soybean milk (Samyook soybean milk) to 2 mL of the lactic acid bacteria culture prepared for each of Examples 1 to 7.

Example 15

- 5 Bean curd was prepared by adding 3 mL of soybean milk (Samyook soybean milk) to 2 mL of vinegar (Double Strength Apple Vinegar, from Otugi Food Company).

Comparative Example 2

- 10 Bean curd was prepared by adding 3 mL of soybean milk to 2 mL of the solution of Comparative Example 1.

Comparative Example 3

Bean curd was prepared by the same method as in Comparative Example 2, except that only soybean milk was used, with no solution.

The results are presented in the following Table 1.

- 15 [Table 1]

	Coagulation
Example 8	O
Example 9	O

ART 34 AMDT**PCT/KR00/01461**

IPEA/KR 22.02.2002

Example 15	O
Comparative Example 2	X
Comparative Example 3	X

As can be seen from the Table 1, in Examples 8 to 14 according to the present invention, soybean milk was coagulated after the lactic acid bacteria culture was introduced to prepare bean curd, while, and it did so quickly, while in Comparative Examples 2 and 3 where the lactic acid bacteria culture was not introduced, soybean milk was not coagulated. Particularly, in the case when radish was used, soybean milk was most rapidly coagulated to prepare bean curd. In addition, even when organic acid such as vinegar was directly added during the bean curd preparing process, soybean milk was coagulated, which indicates that bean curd can be prepared using organic acid.

The present invention uses fermented lactic acid bacteria culture to prepare bean curd, thereby standardizing a bean curd preparation method, and prepares bean curd and a beverage containing lactic acid with improved preservation properties, and increases lactic acid intake thereby improving peoples' health.

In addition, the present invention prepares lactic acid containing bean curd and a beverage by fermenting lactic acid bacteria culture using bean curd dregs that are by-product produced when preparing bean curd and introducing it during the bean curd preparation process, thereby

ART 34 AMDT**PCT/KR00/01461****IPEA/ER 22. 02. 2002**

decreasing preparation costs of bean curd and lactic acid beverages and
providing bean curd and a beverage rich in lactic acid.
